

Thank you for purchasing the **Teixeira Tech Air Box Lift Kit** for **Honda TRX 400X/EX**. This kit has been engineered to raise and allow clearance for your air box from the swing-arm and brake caliper. When using rear suspension that has been set-up for maximum performance, the swing-arm will have more up travel.

1) Remove the air box from ATV and the air filter from the box. Measure 5/8" up from the lip of the air box and cut off stock mount.

2) Place the new aluminum mount against the back of the air box and flush with the top of the cut off mount. Mark the alignment of the 2 holes on the back of the plastic air box mount. Drill the new holes with a 1/4" drill bit.

3) Use a 90 degree counter sink to counter sink the front side of the plastic holes. Go far enough into the plastic so that the screws do not interfere when installing a lid. Screw the new mount onto the air box using Loctite.

4) Use the mounting hole closest to the air box when using a stock carburetor and the hole furthest away from the air box when using a 2004-2005 Honda TRX 450R carburetor.
